Faus unveils two new laminate technologies

Faus Group recently debuted its two latest design and technology innovations in laminate flooring with Inter-Plank Design and Microbevel. Both technologies combine with Faus' Embossed-in-Register and Joint Guard innovations.

Interplank Design is a combination of two planks that complete one continuous wood grain strip. It features a Self-Alignment System, which is an automatic continuation of the pattern between planks.

Microbevel technology embosses a subtle microbevel between each laminate wood strip to provide more depth and realism to the floor. This technology aids in making laminate joints less visible.
